

How Vulletic installed its own Nova charger in a single parking spot

THE CHALLENGE

Many offices and corporate buildings rule out EV charging because they assume it requires space, construction work, or several available parking spots. Vulletic wanted to show firsthand that this isn't the real starting point.

THE SOLUTION

In its own office, with only one parking spot available, Vulletic installed a 22kW Nova charger: the same solution it offers to corporate buildings, requiring much less space than most assume is necessary.

THE RESULT

Vulletic's own office now works as a live showcase: a real, visitable case that shows any corporate or office building that a single spot is enough to start offering EV charging.

"We couldn't ask a corporate building to add EV charging if we hadn't done it ourselves first. With just one parking spot, we installed our own Nova, and today it's the first thing we show when someone thinks they need more space than they actually do."

WHY IT WORKS

- 🏢 Works as a real demonstration case for buildings and offices unsure whether they have enough space.
- ⚡ The same 22kW Nova charger Vulletic offers its corporate clients, tested in-house.
- ✅ Removes the most common entry barrier in the office segment: the idea that a lot of space is needed to get started.
